Wellbeing bundle

The Wellbeing Bundle allows for the identification of multiple causes for health concerns and symptoms. It provides a comprehensive, holistic and functional perspective on health and wellbeing demonstrating the interrelatedness of all systems in the body.

What do the results mean for your patient?

Help your patient identify genetic predispositions that may influence a wide range of functional aspects relating to their health. You will be able to identify genetic factors influencing neurotransmitter production and metabolism, methylation, phase 1 and 2 liver detoxification, reproductive health and endocrine health.

The Clinical Services Wellbeing Bundle is a holistic gene summary designed to assist in developing personalised nutrient strategies. Specific forms of nutrients and dosages can be selected no matter what age or stage of health.

What biological functions are better understood through this bundle?

The Wellbeing Bundle provides a health summary of key single nucleotide polymorphisms (SNPs) and how these impact, and are impacted by, various processes in the body, including:

- methylation
- neurotransmitter production and function
- hormone metabolism
- detoxification
- antioxidant status
- nutrient metabolism, transport and absorption
- cardiovascular disease (CVD) risk
- energy metabolism
- DNA expression.

Patients, symptoms and conditions best suited to this bundle

- Anaemia
- Anxiety
- Attention deficit disorder (ADD)
- Attention deficit hyperactivity disorder (ADHD)
- Autoimmune disease
- Chronic disease states
- Chronic fatigue
- Complex cases with multiple presentations - assists with treatment priorities
- Digestive complaints
- Family history of heart disease
- Fatigue
- Folate and B12 deficiency
- Food intolerances
- General fatigue
- Headaches
- High homocysteine
- History of miscarriage
- Hormonal imbalances
- IBS
- Immune dysfunction
- Inflammatory disorders
- Insomnia
- Irritability
- Leaky gut syndrome
- Longstanding gastrointestinal issues
- Low energy
- Menopausal symptoms
- Migraine
- Mood swings
- Multiple chemical sensitivities
- Neuropathy
- Panic attacks
- Patients interested in achieving comprehensive wellbeing
- Patients interested in addressing root causes of ill health
- Patients interested in undertaking appropriate preventive measures and lifestyle changes to reduce risks for certain diseases
- Premenstrual syndrome (PMS)
- Poor concentration
- Poor memory
- Poor nutritional status despite a healthy diet
- Poor wound healing
- Post-traumatic stress disorder (PTSD)
- Recurrent infections
- Stress
